Product Information :

Pharmaceutical form : Tablet

Category : Anti Cancer

Pack : 1x60/Caps

Brand name : Etravirine Tablet

Content : Etravirine 200mg

Therapeutic Use : To Help Control HIV Infection

Product Description :

What is Etravirine Tablet?

Etravirine Tablet is a medicine that is used in combination with other drugs in the treatment of human immunodeficiency virus (HIV) infection in adults and children aged 2 and up who are no longer responding to existing HIV treatments. Etravirine belongs to a group of drugs known as non-nucleoside reverse transcriptase inhibitors (NNRTIs). It works by lowering HIV levels in the bloodstream. Although etravirine does not eliminate HIV, it can reduce your risk of acquiring AIDS and HIV-related disorders such as serious diseases or cancer. These drugs, together with safer sex practices and other lifestyle modifications, may reduce the risk of transferring (spreading) the HIV virus to others.

Etravirine Tablet - How To Use

- Etravirine is available as a pill that must be swallowed. It's normally taken twice a day, after a meal. Every day, around the same time, take etravirine tablet. Follow the advice on your medicine label carefully. Etravirine tablet should be taken exactly as prescribed. Do not use more or less of it, or take it more frequently than your doctor has suggested.

- Do not split, chew, or crush the tablets; instead, swallow them whole with a beverage such as water.
- If the tablets are difficult to take, they can be dissolved with water. Drink the mixture as soon as possible. Swallow the full contents of the glass after rinsing it with water, orange juice, or milk. Repeat the rinsing and swallowing process many times to ensure that the complete dose is consumed.
- Etravirine assists in the control of HIV infection, but it does not eliminate it. Even if you feel healthy, keep taking etravirine tablet. Your disease may become more difficult to treat if you avoid taking etravirine or miss doses.

Precaution For Etravirine Tablet

- If you are sensitive to etravirine, any other medicines, or any of the components in etravirine tablets, notify your doctor.
- Tell your doctor about any additional prescription or over-the-counter medications, vitamins, or nutraceuticals you're taking or planning to use. Make certain you include the following: certain seizure medications such as carbamazepine, [phenobarbital](#), and phenytoin; clarithromycin; cholesterol-lowering medications such as [atorvastatin](#), fluvastatin. Many other medications may interfere with etravirine, so be sure to notify about all of your prescriptions, even if they aren't on this list.
- Tell your doctor about any herbal supplements you're using.
- If you have or have ever had liver illnesses, including hepatitis, tell your doctor.
- If you are pregnant or expect to become pregnant, notify your doctor. Call your doctor when you become pregnant while receiving etravirine tablet.
- If you have HIV or are using etravirine, you must not breastfeed your baby.
- You should be aware that when taking [HIV drugs](#), your immune system may become stronger and start fighting other infections already present in your body. It's possible that you'll experience symptoms of those infections as a result of this. Tell your doctor if you develop new or severe symptoms after starting etravirine medication.
- Children may be more vulnerable to the drug's adverse effects, particularly rash.

- Many other medications may interfere with etravirine, so be sure to notify doctor about all of your prescriptions, even if they aren't on this list.

Etravirine Tablet - Side Effects

- Nausea is a possibility. Tell your doctor right once if this effect persists or worsens.
- Remember that your doctor provided this medication because he or she believes the advantage to you exceeds the risk of adverse effects. The majority of people who take this medicine do not have any substantial adverse effects.
- Increased thirst/urination, symptoms of kidney difficulties (such as change in the volume of urine), mental/mood disorders (such as anxiousness, confusion), seizures should all be reported to your doctor immediately.
- If any of these rare but significant side effects develop, get medical attention right away: chest/jaw/left arm pain.
- As your immune system strengthens, it may be able to fight off previous infections, leading disease symptoms to resurface. If your immune system gets overactive, you may have symptoms. If you have any serious symptoms, such as unexplained weight loss, severe tiredness, muscle aches/weakness that doesn't go away, headaches that don't go away, joint pain, numbness of the hands/feet/arms/legs, vision problems, symptoms of infection, signs of an overactive thyroid, Indications of Guillain-Barre syndrome (unsteadiness, lack of coordination, difficulty swallowing/speaking/chewing, difficulty moving your eyes), and signs of liver illness.
- While using this medicine, you may notice changes in your body fat. The causes of these changes, as well as their long-term consequences, are unknown. Talk to your doctor about the risks and advantages of treatment, as well as the significance of exercise in reducing this side effect.
- This medicine rarely causes a severe allergic reaction. However, if you detect any symptoms of a major allergic response, such as a rash, itching/swelling, extreme dizziness, or problems breathing, seek medical treatment right once.
- Etravirine can induce a minor rash that is generally not life-threatening. If you develop a rash, seek medical attention right away, especially if you have symptoms like fever,

weariness, muscle/joint discomfort, blisters, mouth ulcers, or red/swollen eyes.

- If you observe any other affects that aren't listed above, please let us know.
